

Course Description: LegaSuite GUI for Developers

During this course participants will learn how to develop a graphical user interface for their green-screen applications using LegaSuite GUI, with course emphasis on how to work with the LegaSuite Workbench GUI Builder.

Course Objectives

- Introduce new LegaSuite GUI developers to the product and provide a solid understanding of how the product's components work together.
- Provide the skills necessary to create LegaSuite GUI panels from an existing application and compile them for deployment to end users.

Target Audience

Application Developers

Prerequisites

Above-average PC skills, including expertise in using a mouse and managing Windows files and directories. Knowledge of how to use your green screen applications is required for successful completion (for example, how to log on and how to perform some business processes).

Topics

- Developer kit concepts and development process
- How to use the Seagull Software Collector to gather data from an existing application
- Developer kit navigation, tips and techniques
- Developer kit project creation and environment configuration
- Project files and work files
- Picture album creation and identification
- Smart Build process
- Panel and screen templates
- Panel development
- Panel field creation and editing
- Host field creation and editing
- Dynamic Build
- Text files and translation tables
- Compilation
- Overview of deployment
- Overview of change management

Course Duration

5 Days
